

*AMENDMENTS TO THE CLAIMS*

This listing of claims replaces all prior versions, and listings, of claims in the application.

1. (Currently Amended) A display device comprising:

a display which is flexible and which may be present in both a first position and a second position, in which in the first position the display is ~~at any rate~~ at least largely rolled up around a shaft in a housing and in which in the a second position at least part of the display is visible,

extension structure to facilitate extending the display to the second position, which display device is provided with support means comprising a foldable arm which arm is foldable around a first hinging point and can be folded along the shaft when the display is in the first position, and which arm supports the display in the second position

characterized in that wherein the extension structure comprises means for generating an extending force acting in an opposite direction with respect to a force driving the display towards the first position upon a transition towards the second position, the display device comprises extending means extension structure further arranged to which facilitate extending the display to the second position and which counteract a tendency of the display to return by itself from the second position to the first position by balancing, in the second position, the extending force and the force driving a display towards the first position when in the second position.

2. (Currently Amended) A display device as claimed in claim 14 ~~+~~, wherein ~~characterized in that~~ the foldable arm is hollow and ~~in that~~ the extension structure ~~extending means comprise~~ comprises a cable and a first pivot, ~~which the pivot is being~~ located on the first hinging point and ~~has~~ having an outside edge, and which cable:

extends in the hollow foldable arm;

is attached to a suspension point in or on the housing;

comprises at least an elastic portion and

is present at the first hinging point along ~~at any rate part of~~ the outside edge of the first pivot when the display is in the first position.

3. (Currently Amended) A display device as claimed in claim 2, ~~characterized in that~~ wherein the elastic portion is a spring which is located between the suspension point and the first hinging point.

4. (Currently Amended) A display device as claimed in claim 1, ~~2 or 3, characterized in that~~ wherein locking means are present with which the display can be locked in at least one position.

5. (Currently Amended) A display device as claimed in claim 4, ~~characterized in that~~ wherein the locking means ~~comprise~~ comprises a rotary disk with which the display can be locked in the first position.

6. (Currently Amended) A display device as claimed in claim 2, ~~characterized in that~~ wherein the first pivot has a non-uniform diameter.

7. (Currently Amended) A display device as claimed in claim 1 ~~or 4, characterized in that~~ wherein

reading means are present to determine to what extent the display in the second position is extended;

driving means are present by which an image is reproduced only on the visible part of the display once the degree of extension of the display in the second position has been determined.

8. (Currently Amended) A display device as claimed in claim 1, ~~characterized in that~~ wherein the flexible display is subdivided into a number of segments oriented parallel to the shaft while each of the segments has a carrier layer.

9. (Currently Amended) A display device as claimed in claim 8, ~~characterized in that~~ wherein the carrier layer is transparent and ~~that~~ reproduction of images during operation of the display takes place through the carrier layer.

10. (Original) A display device as claimed in claim 1, further comprising means for signal transmission to an adjustable external appliance.

11. (Cancelled)

12. (New) A display device according to claim 1, wherein the display is further adapted to be present in a third position wherein the display is at least partially visible, the extension structure being further arranged to counteract a tendency of the display to return by itself from the third position to the first position by balancing in the third position a further extending force and a force driving the display from the third position towards the first position.

13. (New) A display device according to claim 1, wherein the means for generating opposing forces comprise elastic means.

14. (New) A display device according to claim 1, wherein the display is provided with support means comprising a foldable arm that is foldable around a first hinging point and can be folded along the shaft when the display is in the first position, and wherein the foldable arm supports the display in the second position.
